No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Increasing telomere length in cells - to increase proliferative capacity and therefore delay cellular senescence, useful in cell therapy and transplantation.

Claim 12; Page 29; 38pp; English.

Oligonucleotides AAT05734-7 are examples of telomerase substrates used to increase the proliferative capacity of normal cells that express telomerase activity. The oligonucleotides allow an increase in length of telomeres in normal cells and in hybrids of normal and immortalised cells. The increase in telomere length extends the capacity of cells to replicate, esp. those treated ex vivo and used for transplantation techniques e.g. cell therapy, for the treatment of AIDS, anaemia, leukaemia or lymphoma

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a mouse telomerase reverse transcriptase (mTERT) enzyme. Compositions containing mTERT can be used in telomere length assays. Isolated mTERT is useful as an immunogen for the production of monoclonal or polyclonal antibodies. The method is useful for assessing the degree of purification and identification of new mTERT species, such as an mTERT allele, homolog or isoform, or to screen for modulators (antagonists and agonists) of telomerase-mediated DNA replication. Antagonists and agonists of mTERT can be used to modify the activity of other telomerase enzymes such as human TERT (hTERT)

The invention describes initiation or mammination between the production of proliferation by treating cells with at least one oligonucleotide, or its fragment. The compounds, which have cytostatic, anti-allergic, anti-inflammatory, dermatological, ophthalmological, anti-psoriatic and inflammatory, dermatological, ophthalmological, anti-psoriatic and immunosuppressive activities, function as 'ultra-violet mimics' to induce comparation or chemicals), as a proliferation inhibitor, apoptosis inducer or a tunmour necrosis factor inhibitor. Probably they mimic products of DNA damage, or processed DNA-damage intermediates, by inducing the p53 company, resulting in transient arrest of cell growth, allowing more time corrupts to occur before cell division takes place. The method is especially used to treat carcinoma but may also be used to: treat other corrupts for the proposition of a processed processed of allergically mediated inflammation (atopic or contact dermatitis, allergic rhinitis and conjunctivitis); prevent or reduce DNA damage in caused by radiation or chemicals; increase melanin production conformation in epithelial cells (a.g. for treating vitiligo), and to promote apoptosis, in response to DNA damage, in epithelial cells that contain damaged DNA. Also oligonucleotides that contain non-hydrolyzable backbones are used to inhibit apoptosis, in response to DNA damage, in epithelial cells that contain of the reverse complementary sequence of AAS149015, a truncated version of the sequence complementary sequence over-hang sequence (AAS14901), described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   proliferation by treating cells with at least one oligonucleotide, or its fragment. The compounds, which have cytostatic, anti-allergic, anti-inflammatory, dermatological, ophthalmological, anti-psoriatic and immunosuppressive activities, function as 'ultra-violet mimics' to induce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DNA repair processes (or a protective response to later exposure to radiation or chemicals), as a proliferation inhibitor, apoptosis inducer or a tumour necrosis factor inhibitor. Probably they mimic products of DNA damage, or processed DNA-damage intermediates, by inducing the p53 pathway, resulting in transient arrest of cell growth, allowing more time for DNA repair to occur before cell division takes place. The method is especially used to treat carcinoma but may also be used to: treat other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           hyperproliferative states (e.g. psoriasis or precancerous conditions); reduce photoaging, oxidative stress or damage; prevent skin cancer, treat allergically mediated inflammation (aropic or contact dermatitis, allergic thinitis and conjunctivitis); prevent or reduce DNA damage in cells caused by radiation or chemicals; increase melanin production (pigmentation) in epithelial cells (e.g. for treating vitiligo), and to promote apoptosis in epithelial cells that contain damaged DNA. Also oligomucleotides that contain non-hydrolyzable backbones are used to inhibit apoptosis, in response to DNA damage, in epithelial cell. This sequence is melanogenesis associated oligomucleotide #11, a truncated version of the sequence representing the telomere over-hang sequence (AAS14909) and one of the oligomucleotides used to inhibit mammalian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (AAS14909) and one of the oligonucleotides used to inhibit mammalian epithelial cell proliferation, described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Inhibiting proliferation of epithelial cells, useful e.g. for treating carcinoma, using specific oligonucleotides that mimic the effects of ultra-violet light.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  invention describes inhibition of mammalian epithelial cell
                                                                                                                                                                                                                                                                                                           conjunctivitis; allergic rhinitis; vitiligo; ss
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 6 BP; 1 A; 0 C; 3 G; 2 T; 0 U; 0 Other;

The present invention describes an expressed sequence tag (EST), where the EST is an isolated, enriched, or purified nucleic acid sequence representing all or part of a gene, the expression of which, or its complementary sequence, the arguestes the cell as a developmentally competent or incompetent cell. Molecules which induce developmental competence in a cell line are useful for inducing totipotence in one or more cells. Molecules which induce developmental incompetence in a cell line are useful for preventing a full term pregnancy in an animal and inhibiting totipotence. The molecules are also useful for treating a disease in an animal by inducing development of one or more cells of the animal into a specific cell type. The present the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The invention relates to inhibiting growth of cancer cells, which is independent of presence or activity of telomerase in cells, not requiring the presence or activity of p53 normal function in cells, not regulting in S-phase arrest in cells, and inducing apoptosis in cancer cells, or resulting involving administering a composition comprising oligonucleotides which share at least 50% sequence identity with human telomere overhang repeat, corrigious portion) and is used in a method inhibiting proliferation of epithelial cells in a mammal or preventing/reducing DNA damage in cells of a mammal, where the DNA damage is caused by radiation or DNA-damaging chemicals. The method is useful for inhibiting growth of cancer cells chemicals. The method is useful for inhibiting growth of cancer cells capamous cell carcinoma), for inducing apoptosis in cancer cells in human, promoting differentiation of malignant cells in a mammal, chancing the expression of one or more surface antigens (e.g. MART-1, tyrosinase, TRP-1 or gp-1100) indicative of differentiation of cancer cells cancer cells in the skin of a mammal, skin cancer in a human with xeroderma or promoting the expression of one or spongiosis, blistering or dyskeratosis in the skin of a mammal, skin cancer in a human with xeroderma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Inhibiting growth of cancer cells and inducing apoptosis in cancer cells, by administering composition having oligonucleotides that share sequence identity with human telomere overhang repeat.

Inhibiting growth of cancer cells and inducing apoptosis in cancer cells, by administering composition having oligonucleotides that share sequence identity with human telomere overhang repeat.

Claim 44; Page 18; 65pp; English.

The invention relates to inhibiting growth of cancer cells, which is independent of presence or activity of telomerase in cells, not requiring the presence or activity of p53 normal function in cells, not resulting in S-phase arrest in cells, and inducing apoptosis in cancer cells, or resulting in cancer cells, involving administering a composition comprising oligonucleotides which share at least 50% sequence identity with human telomere overhang repeat, (TTAGG)n. The composition may contain 2 of the oligonucleotides (or their contiguous portion) and is used in a method inhibiting proliferation of epithelial cells in a mammal or preventing/reducing proliferation of cells in the method is used in a method inhibiting proliferation of chemicals. The method is used in a method inhibiting proliferation of chemicals. The method is used in a method inhibiting growth of cancer cells of squamous cell carcinoma), for inhibiting growth of cancer cells in a mammal, promoting differentiation of malignant cells in a mammal, chuman, promoting differentiation of malignant cells in a mammal, consinase, TRPP-1 or gp-1100) indicative of differentiation of cancer cells (especially melanoma cells) in a human and for treatment of other hyperproliferative disorders (e.g. spongiosis, blisterntiation of a mammal, skin cancer in a human with xerodermal or phagmentosum, seborrheic keratosis, actinic keratosis, Bowen's disease, or basal cell carcinoma) and for treating or preventing pre-cancerous

conditions affecting epithelial cells (such as psoriasis and atopic dermatitis) and also the types of cancers of breast, lung, liver, prostate, pancreatic, ovarian, bladder, uterine, colon, brain, oesophagus, stomach, and thyroid. The present sequence is the complement of telomere repeat unit sequence found to be less active in melanogenesis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Tandem repeats (1-1000) of the telomere are used in a vector for expressing specific genes in plants. They provide 'artificial chromosomes' which are maintained in the nucleus, so are not subjected to variable expression due to integration-position effects. They allow the integration of very foreign DNA without host range limitations. The telomere opt. contains variant repeats of CTCTRAA. The telomere is pref. the pAt14 plasmid (ATCC 67577). (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New recombinant DNA contg. eukaryotic telomere esp. from higher plant useful as vector for specific genes and maintained in nucleus as independent replicating molecule.

New peptide nucleic acid (PNA) oligomers are provided which (a) consist of naturally occurring nucleobases covalently bound to a polyamide backbone and (b) hybridise to the translation initiation Aug region, 5' contranslated region (3' UTR), splice curranslated region (3' UTR), splice curranslated region (3' UTR), splice curranslated business of a be used to target chosen from env, gag, pol, rev and tat. The PNAs can be used to target consen from moieties. They have utility as gene-targetted drugs for regulation moieties. They have utility as gene-targetted drugs for modulating HIV processes. Hence they can be used to treat AIDS and other contral infections. They are also useful in diagnostic applications and as research tools. PNA oligomers have high affinity for complementary single stranded DNA. They are also able to form triple helices in which a first or stranded DNA. They are also able to form triple helices in which a first pNA strand binds with the first pNA strand. The PNAs possess no significant charge and are water soluble, which facilitates cellular contake. Further, since they contain amides of non-biological amino acids, they are biostable and resistant to enzymatic degradation by proteases. The present sequence is a specifically claimed PNA sequence (represented by the sequence of nucleobases) targetting HIV genes. (Updated on 25-MAR-
being formed by condensation of the glycine carboxy group of one residue with the amino group of the 2-aminoethyl moiety in the next residue"
                                                                                                                                                                                                                                                                                                                                                 Oligomer hybridisable to HIV sequence and contg. peptide nucleic acid sub:unit - binds in complementary manner to DNA and RNA, and useful for modulating HIV viral activity, e.g. in treating AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Peptide nucleic acid; PNA; cancer; telomerase; probe; hybridisation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Peptide nucleic acid 14, targeted to mammalian telomerase.

The PNAs hybridise specifically to an RNA component of mammalian telomerase, and include the sequence GGG for specific hybridisation to the template region of this component. PNAs can be used as probes to detect the RNA component of mammalian telomerase and as inhibitors of telomerase activity, especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Peptide nucleic acid; PNA; telomerase; ribonucleoprotein enzyme; cancer; inhibitor; neoplasia; neurodegenerative disease; aging; hyperplasia; AIDS; HIV; fungal infection; forensic identification; detect; tumour; paternity testing; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New peptide nucleic acids hybridising to mammalian telomerase RNA - used to inhibit telomerase, for treating tumours and other proliferative diseases, also for diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /*tag= a

PNA sequence #30 used to inhibit telomerase activity.

Synthetic

The present sequence represents a peptide nucleic acid molecule which the present sequence represents a peptide nucleic acid molecule which hybridises to the mRNA component of mammalian telomerase, and inhibits telenarase activity. Telomerase is a ribonucleoprotein enzyme that component activity. Telomerase is a ribonucleoprotein enzyme that invented strands of the telomeric DNA, using as a template an 11 invention relates to PNA molecules having a sequence of no more than 25 comesses, which include the sequence GTTAGG. The uncharged nature of the PNA increases the melting temperature of associating strands, increases the rate of association with targeted nucleic acids, and affords greater resistance of degradation by proteases or nucleases. The cancers, neophasia, hyperplasia, neurodegenerative diseases, and other contains and associated pathologies, fungal infections, and other contains and associated pathologies, fungal infections, and other cyctoxic or diseases characterized by abnormal telomera metabolism or telomerase custivity, in combination with antineoplastic and other cyctoxic or cytostatic agents, antifungal agents, and other nucleotides. PNAs may be used for molecular diagnostics, labelled PNAs are used as hybridization probes to detect or quantitate polynucleotides having a human telomerase of telomerase and as not individuals, e.g. paternity testing, based on hTR gene restriction of individuals, e.g. paternity testing, based on hTR gene restriction continity testing, based on hTR gene restriction allows cancerous conditions to be detected with increase and as inhibitors of telomerase activity. The method of the present invention allows cancerous conditions to be detected with increased confidence and possibly at an earlier stage, before cells are detected as cancerous conditions to be detected with increase and man telomerase activity. The method of the present invention can be used to detect an immortal or neophastic cell or tumour tissue or cancer of any origin, provided the New peptide nucleic acid (PNA) compounds that inhibit telomerase activity in mammalian cells is useful as probes to detect the RNA component of a Corey DR; Norton JC, Shay JW, Claim 6; Col 71; 45pp; English. New peptide nucleic acids that hybridizes to the RNA component of mammalian telomerase, useful for treating or preventing cancer, inflammation, lymphoproliferative diseases, autoimmune disease, or neurodegenerative diseases.

Claim 7; Col 73; 46pp; English.

The present invention relates to peptide nucleic acids (PNAs), comprising a sequence of 6-25 nucleobases, that inhibit telomerase activity in mammalian cells by hybridising to the RNA component of mammalian telomerase and as inhibit tors of telomerase activity, or to detect and/or quantitate polynucleoride having the human telomerase RNA component (HTR) sequence, as well as in forensic identification of individuals, such as paternity testing or identification of criminal suspects or unknown descendants based on the HTR gene RFLP pattern. The suspects or unknown descendants based on the hTR gene RFLP pattern. The lymphoproliferative diseases, autoimmune disease, or neurodegenerative diseases. The PNAs in combination with other pharmaceuticals (such as antineoplastic or cytostatic agents) can be used for treating neoplassic, human immunodeficiency virus (HIV) infections, acquired immunodeficiency syndrome (AIDS) and associated pathologies, and other diseases characterised by abnormal telomere metabolism or telomerase the contract of the con sequence represents one of the PNA sequences of the activity. GENERAL INFORMATION:

```
Sequence 63, Application US/10336265
Publication No. US20030148988A1
GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: Telomere-Encoding Synthetic DNA Nanocircles, and their use for TITLE OF INVENTION: The Elongation of Telomere Repeats
TITLE OF INVENTION: the Elongation of Telomere Repeats
TITLE OF INVENTION: the Elongation of Telomere Repeats
CURRENT PRINCATION NUMBER: US/10/336,265
CURRENT PRINCATION NUMBER: US 60/345,056
PRIOR PRILING DATE: 2002-01-04
NUMBER OF SEQ ID NOS: 64
APPLICANT: Kool, Eric T.
TITLE OF INVENTION: Telomere-Encoding Synthetic DNA Nanocircles, and their use for TITLE OF INVENTION: the Elongation of Telomere Repeats

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AZ392246
1M0154G12R Mouse 10kb plasmid UUGCIM library Mus musculus genomic clone UUGCIM0154G12 R, genomic survey sequence.
PHRAP suite. Poly-T Identification: patMatch.pl from Berkeley Drosophila Genome Project. University of Washingtion Genome Center: http://www.ashington.edu Low Quality Sequence: 15 contiguous PHRED high quality bases following vector sequence. Very Low Quality Sequence: Trace file contained 16 contiguous distinct peaks following vector sequence. Polyadenylation: Based upon the presence of a XhoI site followed by a run of 14 or more T residues at the beginning of the sequence, this cDNA insert was polyadenylated.

(http://www.jax.org/resources/localcury mouse punk resource that the the theory as a very resource documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligomuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pw042 (gil 4732114|gb|AR129072.1), a copy.number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouses DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xiilo-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Buteleostomi;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  g
                                                                                                                                                                                                                                                                                              (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gelectrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114|gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                셤
                                                                                                                                                                                                                                                                                                                                                                (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWaD42 (gil #732114 [gb] AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to chemically-competent B. coli X110-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                             (http://www.jax.org/resources/documents/dhares/). The DNA was hydrodynamically sheared by repeated passage through a was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pm/2 (gil 47321141gb] AR129072.1), a copy-number of pm/2 (gil 47321141gb] AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Mus musculus

musucular C.) was pury on (ward) was brother than the bund was hydrodynamically sheared by repeated passage through a was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymorlectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 k range using preparative agarose gfrom a derivative of pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             E

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ð
                                                                                    (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide Kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil 47421141gb] AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xil0.0601d (Stratagene) cells and selected for ampicillin resistance."

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil 47321141gb) AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to chemically-competent E. ond transformed into chemically-competent E. and transformed into adaptored for ampicillin resistance."

                                                                                                                                    Dp
                                                                                              ð
                                                                                   (http://www.jax.org/resources/
(http://www.jax.org/resources/
(http://www.jax.org/resources/
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligomucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWnp(2 (gil 4732114)gb]AFL29072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Constructed at the Institute for Genomic Research (TIGR), Rockville, MD. Genomic DNA isolated from a cloned population of Trypanosoma bruce; (TREU927/4 GUTAT 10.1) was mechanically sheared to give a tight size distribution (4 kb). The v + 1 method used for the library construction is described in detail in Smith, H. and Vener, J.C. (Maxing small insert libraries for whole genome shotgun sequencing small enome Sequencing: A practical Approach, eds. M. Vaudin and B. Barrell, Oxford University Press, 1999).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               GSS 13-DEC-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Email: nelsayed@tigr.org
Details of T. bruce; sequencing at the Sanger Centre are available at http://www.sanger.ac.uk/Projects/T_brucei/.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Constructed at the Institute for Genomic Research (TIGR), Rockville, MD. Genomic DNA isolated from a cloned population of Trypanosoma brucei (TREU927/4 GUTat 10.1) was mechanically sheared to give a tight size distribution (4 kb). The v + i method used for the library construction is described in detail in Smith, H. and Venter, J.C. (Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Email: nelsayed@tigr.org

Trimming vertor sequence. Trace file contained 21 contiguous distinct

peaks following vector sequence. Polyadenylation: Based upon the

presence of a XhoI site followed by a run of 14 or more T residues

poly-denylation.

Hong/Rubin Laboratory CDNA Library Arrayed by: The I.M.A.G.E.
Consortium (LLNL) DNA Sequencing by: Berkeley MGC sequencing
project Clone distribution: MGC clone distribution information can
be found through the I.M.A.G.E. Consortium/LLNL at:
www-bio.llnl.gov/bbrp/image/image.html Base Calling / Quality
Scores: PHRED from University of Washingtion Genome Center. Vector
Trimming: cross_match from University of Washingtion Genome Center.
PHRAP suite. Poly-T identification: patMatch.pl from Berkeley
brosophila Genome Project. University of Washingtion Genome Center:
http://www.genome.washington.edu Low Quality Sequence: 10
contiguous PHRED high quality bases following vector sequence. Very
Low Quality Sequence: Trace file contained 21 contiguous distinct
peaks following vector sequence. Polyadenylation: Based upon the
presence of a XhoI site followed by a run of 14 or more T residues
polyadenylated.

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
